

RESEARCH DESIGN AND METHODS

The study was conducted in two phases. In the first phase, a series of focus group discussions were held with a sample of young people from the target population. The purpose of these discussions was to explore the range of issues that might be relevant to the development of the intervention. In the second phase, a larger sample of young people was recruited to participate in a series of workshops. The purpose of these workshops was to develop and refine the intervention materials.

RESULTS

The results of the focus group discussions and workshops are presented below. The findings indicate that there is a need for an intervention that addresses the specific needs of young people in the target population. The intervention should focus on building self-esteem, improving communication skills, and providing information about available resources.

CONCLUSIONS

The findings of this study suggest that a targeted intervention is needed to address the needs of young people in the target population. The intervention should be designed to build self-esteem, improve communication skills, and provide information about available resources.
